

Saltire Software Technical Report TR 2022-2

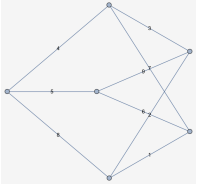

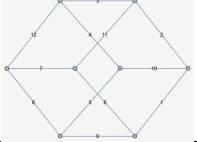

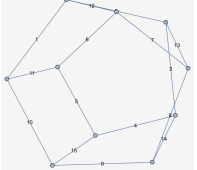

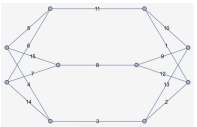

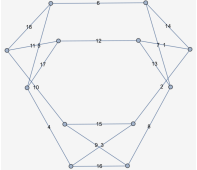

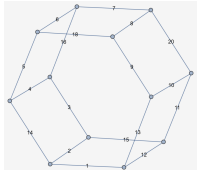

We define A Bisector Matrix as one which has three non-zero terms per row: one with value -2 and two with value 1.

The underlying graph of a matrix (if it exists) has an adjacency matrix with non-zero elements in the same places.

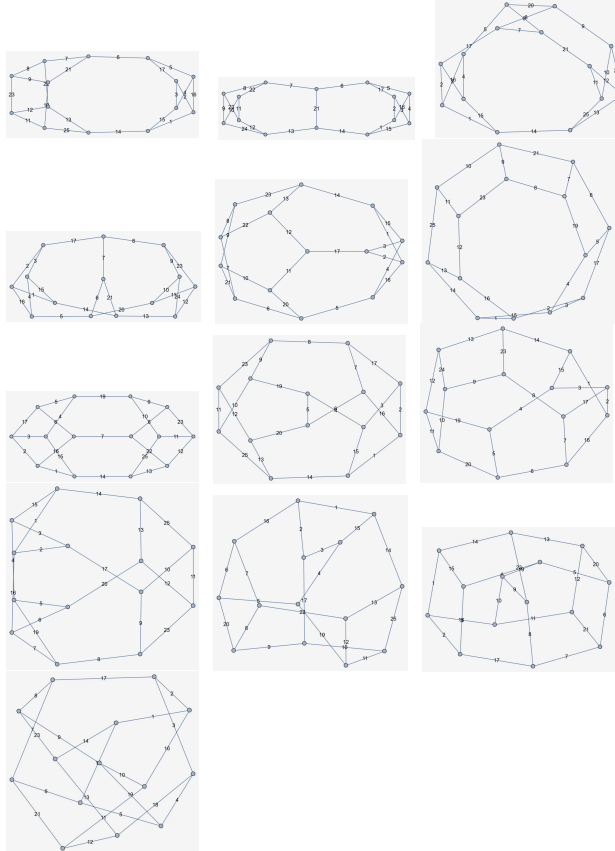

If a rank deficient bisector matrix has a underlying graph, then the graph is bicubic.

We list here the non-isomorphic rank deficient bisector matrices with 6,8,10,12,and 14 rows. (The number of rows must be even as the graph is cubic.)

Matrices are listed according to the shape of their underlying graph.

Matrix representation

The matrices are represented as sets of triplets. Each triplet contains the information on the location and content of the non-zero elements in that row. The first two elements of the triplet give the locations of the elements with value 1, while the third element gives the location of the -2 value in that row.

For example, the triplet {1,7,6} specifies a matrix row with a 1 in column 1, a 1 in column 7 and a -2 in column 6, and zeros elsewhere.

For example, the triplet set

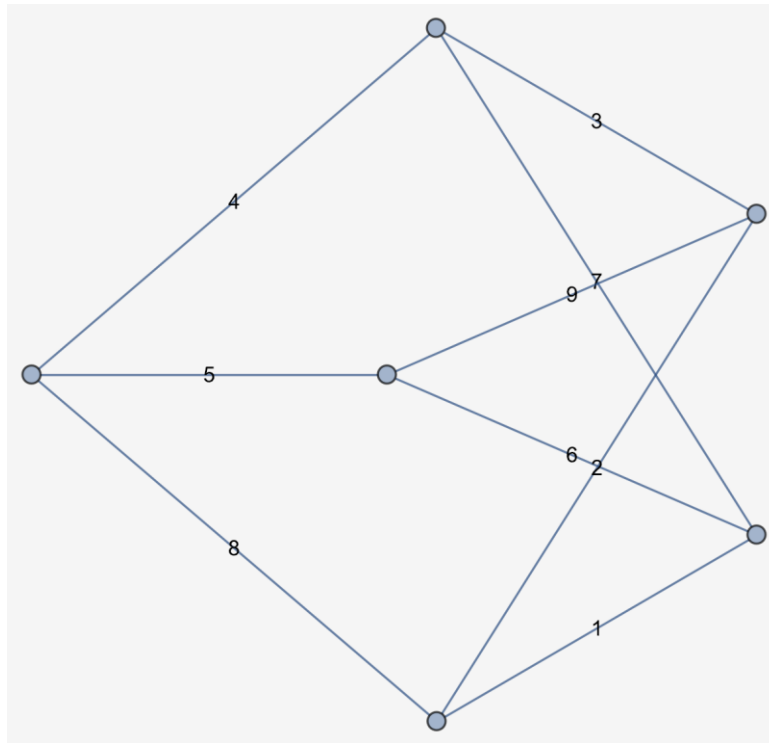

$\{\{1,7,6\},\{2,8,1\},\{2,3,9\},\{3,4,7\},\{4,8,5\},\{5,9,6\}\}$

corresponds to the matrix:

$$\begin{pmatrix} 1 & 0 & 0 & 0 & 0 & -2 & 1 & 0 & 0 \\ -2 & 1 & 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & -2 \\ 0 & 0 & 1 & 1 & 0 & 0 & -2 & 0 & 0 \\ 0 & 0 & 0 & 1 & -2 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 1 & -2 & 0 & 0 & 1 \end{pmatrix}$$
